

G GUIDELINES FOR CLEANING, DISINFECTING AND FUELING CREW VEHICLES

The following guidelines have been adapted from the USDA National Forest Service's protocol for cleaning and disinfecting vehicles.

GUIDELINES FOR CLEANING & DISINFECTING CREW VEHICLES

Where vehicles are used to transport more than one person from a separate household:

- The number of people in the vehicle should be limited to allow all riders to remain 2m apart.
- Ensure that the same people share the same vehicle to minimize exposure.
- The driver or a passenger must clean and disinfect the vehicle after use. Discretion should be used on whether the vehicle should be cleaned and disinfected before use.

To clean and disinfect the vehicle:

1. Wear all personal protective equipment as recommended by the manufacturer of the cleaning and disinfecting product that is being used.
2. If surfaces are noticeably dirty, clean soiled surfaces with a detergent or soap and water before disinfecting.
3. Use a disinfectant to clean all soft and hard surfaces in the vehicles such as:
 - » Keys
 - » External and interior door handles
 - » Steering wheel
 - » Gear shifter
 - » Internal controls (e.g. radio, window, temperature dials)
 - » Seatbelts
 - » Seats
 - » Arm rests
 - » Dashboard
4. Remove and properly discard of all personal protective equipment.
5. Wash or disinfect your hands.
6. Complete any required cleaning and disinfecting logs.

When fueling the vehicle:

- Consider disinfecting the fuelling nozzles and key pads before use.
- Disinfect your hands after using the fuelling nozzles and key pads before touching your face.

Trail operators should ensure each vehicle contains sufficient cleaning and disinfectant solutions, personal protective equipment and alcohol based hand rubs with 60% alcohol to allow for proper vehicle cleaning.
